

Programming language(Python)

Agenda

- What is a programming language
- Working with Python using an online code editor (REPLit)
- Python basics
- Reading materials

What is a programming language

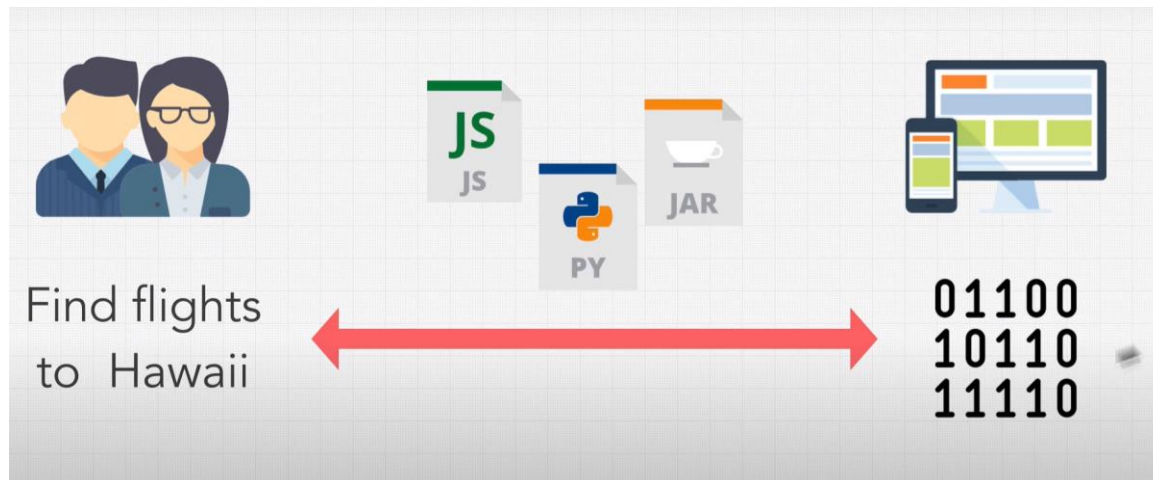

- Programming (also known as coding) is the process of writing instructions to a device, such as a computer or mobile device.
- We write these instructions with a programming language, which is then interpreted by the device
- These sets of instructions may be referred to by various names, but *program*, *computer program*, *application (app)*, and *executable* are a few popular names.
- A *program* can be anything that is written with code; websites, games, and phone apps are programs

How do programming languages work

You **write code** to tell it what to do

The code is **compiled**, which turns it into machine code the computer can understand.

The computer **executes** the code

Interpreter translates just one statement of the program at a time into machine code. **Compiler** scans the entire program and translates the whole of it into machine code at once

Python

- Python is a general-purpose interpreted, interactive, object-oriented, and high-level programming language.
- Created by Guido van Rossum, first released it in 1991 as Python
- Python is designed to be highly readable. It uses English keywords frequently whereas other languages use punctuation

16 Famous Companies that uses PYTHON

Applications

What to master when learning a programming language

LEARNING A LANGUAGE

Best Practices

Data Types

Actions

Download Python
